973.                        Commented to: Say you have a sound coming from the
      speaker.↵
974. ↵
975. You then set up, lets get a nice round number here, 1024 harmonic
      oscillators that resonate to specific frequency ranges.↵
976. ↵
977. Play the sound for, say, a second.↵
978. ↵
979. Oscillators begin to resonate to the sound coming from the speaker.
      After the said second you read how much every oscillator is
      resonating. As a result you get a discrete fourier transform, meaning
      you get a chart of how much each of the frequency ranges contributed
      to the sound coming from the speaker.↵
980. ↵
```

981. Instead of visualising the sound as amount of air pressure caused by the waveform, changing in time slots, you visualized it as a series of intensities of the frequency ranges.↵
982. ↵
983. Of course in explaining the DFT, the speakers part is not really appropriate since you have to work on sampled input. So in this case the 1024 digital "oscillators" should actually be measured after 1/44th of a second, given the audio is sampled at the rate of 44kHz.↵
984. ↵
985. Fast Fourier Transform is an algorithm to perform a Discrete Fourier Transform thats pretty easy for computers to run on an incoming signal. It imposes some constraints you have to work with in your implementation (e.g. the number of samples has to be a power of 2), because it uses some clever tricks to drastically reduce the amount of calculation performed on the sample buffer.↵
986. ↵
987. There is really no need to go deeper, since the two links I gave provide a pretty clear explanation. And note that its impossible to go from theory to implementation without knowing the math behind it.↵
988. ↵
